Abstract:

Human resources (HR) is one important part in an organization (company). The amount of information that must be managed related to human resources raises problems with a high level of complexity. Human Resource Information System (HRIS) is a system that collaborates and combines activities related to the Human Resource Department (HRD) management. HRIS is an important key in HRD to automate several functions and increase efficiency. Garuda Sentra Medika (GSM) Clinic is a Strategic Business Unit of PT. Garuda Indonesia (Persero) whose main function is to carry out management of health facilities and services for Garuda Group employees and their families, as well as third parties in need. HR management by other vendors at Garuda Sentra Medika (GSM) Clinic makes it difficult to analyze staffing data (Recruitment, employee attendance and performance. employees). To solve this problem, we need a web-based human resource information system that is integrated with third parties.

Keywords — Human resources (HR), Human Resource Information System (HRIS), Garuda Sentra Medika (GSM) Clinic

I. INTRODUCTION

The very rapid development of information technology has an impact on the use of information technology on a large scale by companies and agencies in order to improve organizational performance, this can be seen from the easier it is to obtain the infrastructure of information technology itself. Therefore, the process of delivering messages, information and knowledge can be faster, easier and up to date.

In the field of management, it is explained that one of the elements in the organization is human resources [1]. Human resources (HR) is an important part of an organization or company [2]. The amount of information that must be managed and the complexity of business processes related to human resource management, raises its own problems if it is processed and managed manually. With the current technological developments, it is not impossible that these problems can be overcome.

A human resource information system or Human Resource Information System (HRIS) can be defined as an integrated system used to collect, store and analyze information about human resources in an organization consisting of databases, computer systems, hardware and software required. to collect, record, store, manage, provide, present and manipulate data for human resource functions [2].

Garuda Sentra Medika (GSM) Clinic is one of the Strategic Business Units (SBU) of PT. Garuda Indonesia (Persero), whose main function is to manage health facilities and services for Garuda Group employees and their families, as well as third parties in need. In addition, the Garuda Sentra Medika clinic also manages special services in the aviation medicine sector as one of its aviation business support services, such as crew health care, air medical evacuation, and medical assistance.

Garuda Sentra Medika clinic has two employment statuses, namely permanent employees and temporary employees or outsourcing. The process of managing human resources at the Garuda Sentra Medika clinic was previously managed centrally by the HR department of PT. Garuda Indonesia (Persero). Due to the increasing number of outsourcing employees from various branches, the HR of PT. Garuda Indonesia (Persero) decided to hand over the management of outsourced employees to vendors or third parties.

II. RESEARCH METHOD

A. Data Collection Method

1. Literature Study

Collecting data by using or collecting written sources by reading, studying and recording important things related to the issue being discussed in order to obtain a theoretical picture.

2. Documentation

This technique is used to collect documents related to human resources management system problems.

3. Observation

Collecting data by direct observation of the Garuda Sentra Medika Clinic, by recording important things related to the report, so that complete and accurate data is obtained.

4. Interview

Data collection techniques were carried out through face-to-face and direct question and answer between researchers and sources.

B. Research Method

The research method used is qualitative research. Qualitative research is methods for exploring and understanding the meaning that some individuals or groups of people perceive as derived from social or humanitarian problems. This qualitative research process involves important efforts, such as asking questions and procedures, collecting specific data from participants, analyzing data inductively from specific themes to general themes, and interpreting the meaning of the data.

III. DESIGN ANALYSIS

A. Analysis of Current Process

There are several business processes at this point that will be the main analysis

1. Outsourced Personnel Recruitment Process business

profile matchups or candidate data matching based on the files that have been sent at the time of job advertisement. HRD will match employee data with the TAD specifications provided by the user. After matching the data, the HRD calls the candidates who are judged to have a match with the predetermined specifications to make a psychological selection. After conducting the psychological test selection, the selected candidates will be called back to conduct an interview. In the interview stage, it will be determined which candidates will be accepted as employees of the Sentra Medika clinic.

Files of candidates who have been accepted as employees of the Sentra Medika clinic are then submitted to the outsourcing party for processing. The outsourcing party will summon prospective employees to sign the contract.

2. Employee Attendance Process business

Making attendance reports starts when employees perform daily attendance. At the end of each month, outsourcing employees are required to make attendance and overtime reports. After the attendance and overtime report is made, the outsourcing employee will submit the report to the manager to be signed. After the manager has signed the attendance report and the proposed overtime report, the manager will return the attendance and overtime report to the employee concerned.

The attendance list report and overtime that have been signed by the manager are then submitted to the HRD by the relevant outsourcing employee and the HRD will then submit the report to the outsourcing party for processing.

B. Problem Analysis

Problem analysis is done using Fishbone Diagram or fish bones. The fishbone diagram is a visual tool for identifying, exploring, and graphically depicting in detail all the causes associated with a problem.

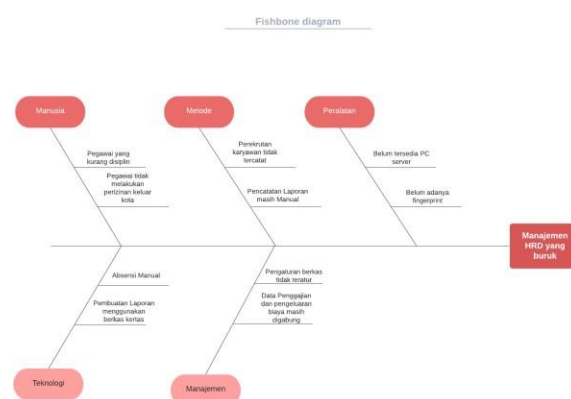

Figure 1 . fishbone diagram

Tabel 1. Fishbone Diagram Analysis

No	Identification of problems	Root of the problem
1	Human	Lack of Discipline Employees Employees do not carry out permits if they leave the city
2	method	Employee recruitment is not recorded Report recording is still manual
3	Equipment	Not yet available server PC There is no fingerprint
4	Technology	Attendance is still manual Making reports is still in paper
5	Management	Irregular file settings Payroll and company expense data are still combined

IV. RESULTS

In analyzing the system development design, the author uses the Unified Modeling Language (UML). The diagrams to be designed are Use Case Diagrams, Activity Diagrams, Sequence Diagrams, and Class Diagrams.

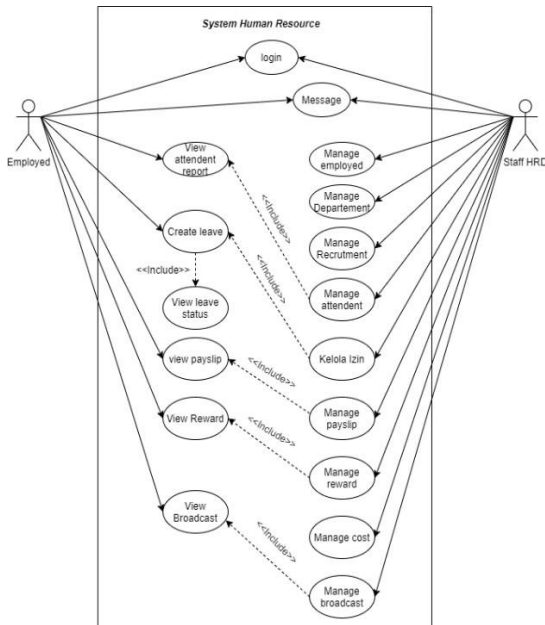

Figure 2. Usecase Diagram

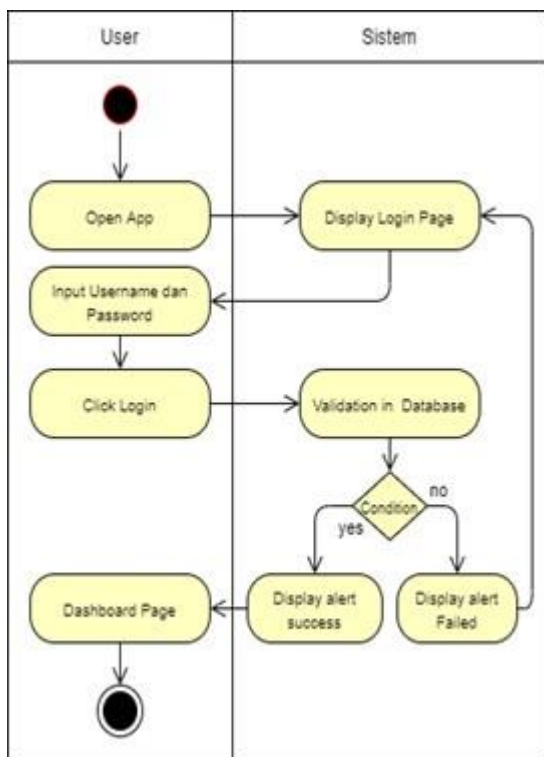

Figure 3. Activity Diagram Login

In the login diagram, HR or employees enter the login page on the website first, then fill in the username and password data which will then be verified by the system and enter the main page

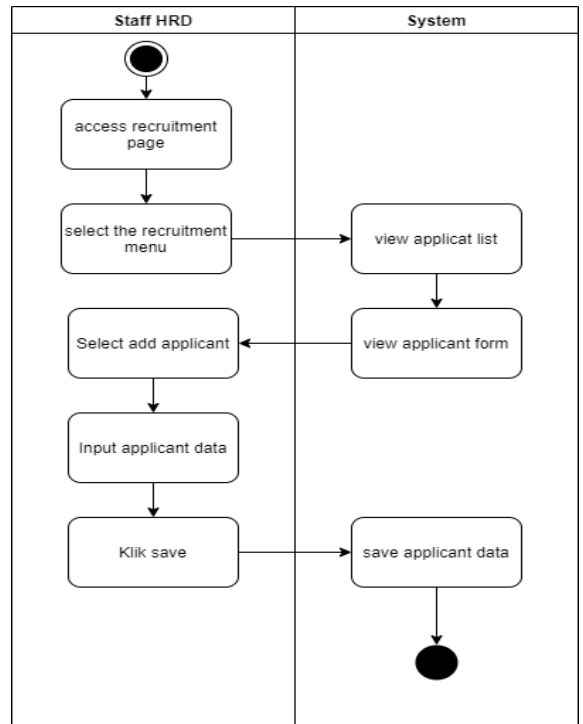

Figure 4. Activity Diagram Recruitment

In the recruitment management diagram, HRD has access to the recruitment page on the website first, then selects the recruitment menu. HRD chooses recruitment monitoring, so HRD will be transferred to the page for monitoring recruitment

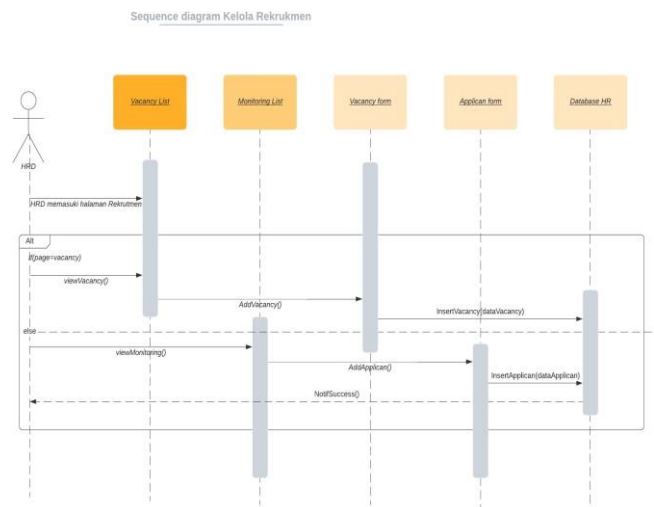

Figure 5. Sequence Diagram Recruitment

There are 5 objects in the recruitment management sequence, namely the vacancy list, monitoring list, vacancy form, applicant form, and HR database. The vacancy list functions to display the list of vacancies that have been inputted while the vacancy form is a form to fill in vacancy data, if HR accesses the monitoring page, there will be a monitoring list object that functions to display the applicant's data that has been inputted, the applicant form functions to display the filled-in form. for applicants who then saved the HR database

users / employees

3. Department and designation are interrelated because each department has employees and the designation or position of each department may be of different types
4. - Applicants and vacancies are related to each other for job vacancies that contain many candidates

The payroll table is used to store payrolls in the system. The explanation can be seen in the following table:

Tabel II

Tabel payroll

No	Field	Type	Keterangan
1.	Payroll_id	Int(11)	Primary Key
2.	Payroll_code	longtext	Payroll code
3.	User_id	Int(11)	Id user
4.	allowance	Long_text	allowance
5.	deductions	Long Text	deduction
6.	date	Long text	date
7.	status	Int(11)	Status payroll

The user table is used to store personal data about system users in this application. The explanation can be seen in the following table:

Tabel III

Tabel User

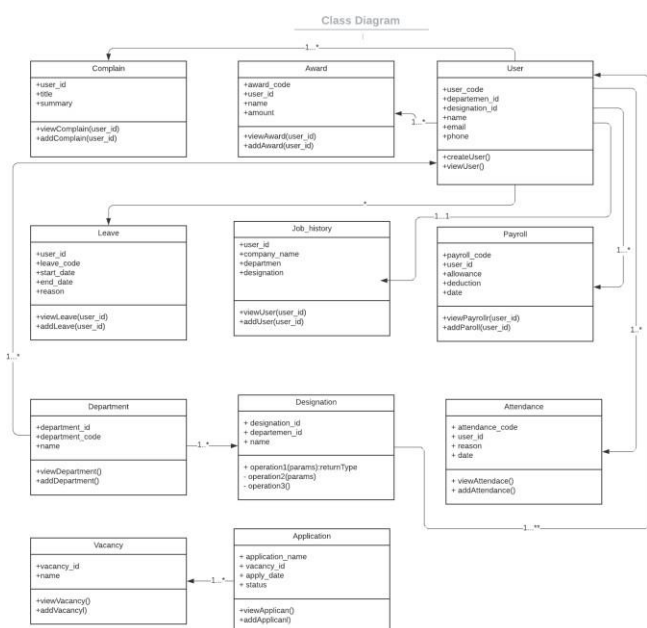

Figure 6. Class Diagram

Class diagram description:

1. Almost all object classes are related to user / employee objects
2. Applicants and vacancies are not related to the user because they are candidate

Applicant table is used to store applicant data.

The explanation can be seen in the following table:

No	Field	Type	information
1.	user_id	Int(11)	Primary Key
2.	user_code	longtext	User code
3.	name	longtext	Employed name
4.	father_name	longtext	Father name
5.	phone	longtext	Phone number
6.	Date_of_birth	longtext	Date of birth
7.	gender	longtext	gender
8.	local_address	longtext	address
9.	Permanent_address	longtext	complete address
10.	nationality	longtext	nationality
11.	Marital_status	longtext	marital status
12.	Email	longtext	Email
13.	password	longtext	password
14.	Department_id	Int(11)	Id departemen
15.	Designation_id	Int(11)	Id designation
16.	Date_of_joining	longtext	Date of joined
17.	Joining_salary	longtext	Salary
18.	status	Int(11)	Employed status
19.	type	Int(11)	Type user

Tabel V

Tabel applicant

No	Field	Type	Keterangan
1.	applicant_id	Int(11)	Primary Key
2.	Applicant_name	Long Text	Applicant name
3.	Vacancy_id	Int(11)	Applicant Id
4.	Apply_date	Long Text	Date of Applied
5.	status	Long Text	Applicant status

And there are several user interface input and output designs in the figure 7- 10

I. CONCLUSIONS

Human resources (HR) is an important part of an organization or company so that the use of HRIS is an important role in managing human resources so that its implementation will result in an increase in the effectiveness of the human resource management function. The problem faced by the Garuda Sentra Medika clinic in managing human resources is the difficulty in analyzing personnel data such as recruitment data and employee attendance data because the data is managed by a third party and there is no system that can accommodate these needs. . From these problems, a web-based human resource information system was designed to facilitate the performance of HRD staff in carrying out the recruitment process and making various reports on human resources at the Garuda Central Medika clinic.
